```
--- Git ---
                                           Clone project:
                                            $ git clone {https://url}
                                           Check status of file changes:
                                            $ git status
                                           Add changes to commit:
                                            $ git add archivo2.txt
                                            $ git add .
                                           Create commit:
                                            $ git commit -m
                                            "Commit description"
                                           Upload commits:
                                            $ git push
                 git checkout -b <br/>branch-name
                        git branch -d <br/>branch-name>
                                                                                                  Delete folder and contents
                                                                                                                       Download changes from repo:
                                                                                              $ git rm -r dirname
                                                                                                      $ git rm dir/nombrearchivo
                                                                                                             $ git pull --all
$ git mv dir/old
                                                                                                                    $ git fetch
                                                                                                             git mv dir/oldname
                                                                                                         dir/newname
                               git diff branch1branch2
                                                                                                                           Git (II)
          git log
love to another branch:
                                            --- BASh ---
                                           show begining of file:
                                            $ head
                            ompare branhces:
-- Git (IV) ---
                                           show end of file:
                     elete a branch
       ommit history:
                                            $ tail
                                           lists files of current folder
                                            $ls
                                             $ git diff branch1 branch2
                                                           Compare branhces:
                                                $ git branch -d <b-name>
                                                             Delete a branch
                                             $ git checkout- b <b-name>
                                                  Wove to another branch:
                                                    $ &if pranch <b style="font-size: 150%;">b gif pranch
                                                  Create branch <br/> p-name>:
                                                         --- Git (III) ---
                                                      $ git merge featurel
                                             Merge feature1 into devolp
                                                                     fluq tig $
                                             Update from remote server:
                                                   $ git checkout develop
                                                   Wove to devlop branch:
                                             --- Werge a new branch ---
                                                             --- Git (V) ---
```
